As classic example is the 'Windows cannot access computer 0x80004005' error.. Fix the Windows cannot access computer error There are a couple of configuration changes that will usually solve the error.. If that didn't stop the error, let us look at the advanced sharing settings • Navigate to Control Panel, Network and Internet, Network and Sharing Center and Advanced sharing settings.. That's what we'll tackle today As usual, Windows is no help when it comes to identifying the cause of the error.. The usual syntax is something like 'Windows cannot access Computer1, Check the spelling Error code 0x80004005 Unspecified error'.. • Click the Private network and make sure network discovery is turned on and that the automatic setup check box is enabled.. While you're in Ethernet Properties, let's check NetBIOS is working • In the same window as above,

---

highlight IPv4 and click the Properties button underneath.. Most network configurations still use IPv4 and will for the foreseeable future so you won't need IPv6 for a while.. Whether you're at home or at work, sharing resources is always more complicated than it should be.. For a supposedly enterprise-friendly operating system, accessing shared folders or network locations in Windows is never easy. 773a7aa168 [free download software mag one a8](#)
